# Frost for the Masses

A (very) brief intro

- Cypher Stack (https://cypherstack.com)
- Stack Wallet (https://stackwallet.com)
- Diego "rehrar" Salazar (owner and UX guy)

The UX of Crypto/Frost

- In one word: Bad!

- Though that's kind of cryptocurrency and multisig in general.

- Every decision to make UX easier often has decentralization trade-offs.

Difficulties: Two round handshake

- To make a wallet or send funds requires two rounds of interactivity between threshold of participants.

- User friction: every step you have a user take, you will lose users (through giving up or error).
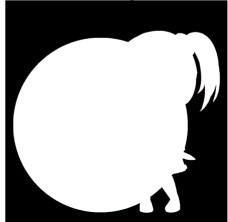

Difficulties: Accurate messaging

- Explaining vocabulary: thresholds, configs, signing, etc.

- Resharing doesn't invalidate old share schemes

- Rehsaring doesn't invalidate "kicked off" wallets from seeing full and continued history

Solutions?

- Grinbox/Epicbox? (i.e. server coordination – means decentralization and privacy trade-off)

- Guided setup and sending?

- Reduce setup and messaging to most common use-cases, leaving more advanced cases for power user software?

Questions?
